

SuperNinja Exporter — Complete User Guide

This toolkit gives you **two separate tools** that both save your SuperNinja (super.myninja.ai) work to your own PC:

Tool	What it saves	Main script	Batch files
1. Chat Exporter	The full conversation of every task (your messages + the AI's replies) as Markdown / JSON / HTML	export_chats.py	3_TEST_FIRST_5.bat , 2_RUN.bat
2. Workspace Downloader	The actual files the AI created in each task's Workspace (code, docs, images, etc.) as a workspace/ folder	download_workspace.py	TEST_DOWNLOAD_FIRST_5.bat , RUN_DOWNLOAD_ALL.bat

Both tools share the **same setup, the same Chrome window, and the same output folder** (SuperNinja_Export). You can run one, the other, or both.

Contents

- [1. What you need first](#)
- [2. One-time setup \(do this once\)](#)
- [3. Every time: start Chrome and log in](#)
- [4. Tool 1 — Chat Exporter](#)
- [5. Tool 2 — Workspace Downloader](#)
- [6. Where your files end up](#)
- [7. Re-running & resuming](#)
- [8. Troubleshooting](#)
- [9. Advanced: config.json settings](#)

1. What you need first

- **Windows** PC.
- **Google Chrome** installed (the normal one — <https://www.google.com/chrome/>).
- **Python 3.11 or 3.12** installed, with "**Add Python to PATH**" **ticked** during install (<https://www.python.org/downloads/>). Python 3.13+ is NOT recommended yet — some packages don't have prebuilt files for it.
- Your **SuperNinja login** (Google or email — whatever you normally use).

Everything runs **on your own computer**. Nothing is uploaded anywhere. The tools simply drive your own Chrome browser and save files locally.

2. One-time setup (do this once)

1. Unzip the superninja-exporter folder somewhere easy, e.g. your Desktop.
2. **Double-click 1_SETUP.bat** .
3. It creates a private Python environment and installs Playwright + Chromium.
4. This takes a few minutes and downloads a browser — that's normal.
5. When it finishes you'll see "**Setup complete!**"

You only ever do this **once** (unless you move the folder to a new PC).

If setup fails mentioning **greenlet** or a **prebuilt wheel**, you're likely on Python 3.13+. Install Python 3.12, delete the venv folder, and run 1_SETUP.bat again.

3. Every time: start Chrome and log in

Both tools need Chrome open in a special mode. This is always your first step, no matter which tool you're running.

1. **Close any other Chrome windows first** (important — otherwise the debug port won't attach).
2. **Double-click 0_START_CHROME.bat** .
3. A fresh Chrome window opens at <https://super.myninja.ai/> .
4. If the page is **blank/white**, press **Ctrl + Shift + R** to hard-refresh. A brand-new profile sometimes needs one reload.
5. **Log into SuperNinja** in that window.
6. Wait until you can **see your list of tasks**.
7. **Leave that Chrome window OPEN.** Don't close it while the tools run. (You can close the little black command window that opened it.)

Your login is remembered in a private profile (the chrome_profile folder), so next time you usually won't have to log in again.

4. Tool 1 — Chat Exporter

Saves the conversation text of each task. Every task becomes a folder containing the chat in Markdown, JSON, and HTML.

Test it first (recommended)

1. Make sure Chrome is open and logged in (Section 3).
2. **Double-click** `3_TEST_FIRST_5.bat` .
3. It exports only the **first 5 tasks** so you can check the results quickly.
4. Look inside the `SuperNinja_Export` folder. You should see 5 task folders, each with the chat files inside.

Export everything

1. Chrome open and logged in.
2. **Double-click** `2_RUN.bat` .
3. It asks two questions:
4. **Start at task number [1]:** press **Enter** to start at the beginning, or type a number (e.g. `6`) to skip ones you already did.
5. **End at task number [all]:** press **Enter** to go to the very end, or type a number to stop there.
6. It works through each task and saves the chats. Let it run.

Long chats are handled in a memory-safe way so Chrome won't crash on huge conversations.

5. Tool 2 — Workspace Downloader

Saves the actual files the AI produced in each task's Workspace. For each task it: opens the task → opens the **Workspace Files** panel (the folder icon) → clicks the **"..." (Global actions)** menu → clicks **"Download all"** → and captures the resulting `.zip` into that task's folder, then unzips it into a `workspace/` subfolder.

Test it first (recommended)

1. Make sure Chrome is open and logged in (Section 3).
2. **Double-click** `TEST_DOWNLOAD_FIRST_5.bat` .
3. It downloads the workspace files for the **first 5 tasks** only.
4. Check the `SuperNinja_Export` folder — each of those task folders should now contain a `workspace/` subfolder with the files inside.

Download everything

1. Chrome open and logged in.
2. **Double-click** `RUN_DOWNLOAD_ALL.bat` .
3. It asks the same **Start / End** questions as the chat exporter — press **Enter** for both to do all tasks.
4. Let it run. Big workspaces can take a while to package and download — the tool waits patiently (up to 10 minutes per download by default).

What you'll see while it runs

- `workspace panel open` — it found and opened the Workspace Files panel.
- `file list rendered; 'Global actions' kebab ready.` — it confirmed the panel is fully loaded **before** clicking (so it won't misfire on a slow load).
- `clicking 'Global actions' kebab at (x,y)...` — opening the **"..."** menu.
- `saved workspace.zip (NNNN bytes).` — success for that task.

If a task won't download

- It **tries each task twice**, then **moves on** so one stubborn task can't freeze the whole run (you'll see `FAILED after 2 attempt(s); ... moving on`).
- At the **end of the run** it prints a list of any tasks that didn't complete and writes them to `SuperNinja_Export\INCOMPLETE_TASKS.txt` (with each task's number and URL) so you can re-run just those later.

Note about the browser's Downloads folder: the zip is captured straight into the task folder. If a particular build ever routes it to your normal Chrome Downloads folder instead, that's fine too — the tool notes it in the per-task log.

6. Where your files end up

Everything lands in the `SuperNinja_Export` folder, one subfolder per task:

```
SuperNinja_Export\
├─ My-First-Task-Title\
│   ├── chat.md           <- from the Chat Exporter
│   ├── chat.json
│   ├── chat.html
│   ├── workspace.zip     <- from the Workspace Downloader
│   ├── workspace\       <- unzipped files (code, docs, images...)
│   │   ├── report.pdf
│   │   └─ src\...
```

```

| | | ...
| | workspace_download.log <- per-task log for the downloader
| | Another-Task-Title\
| | | ...
| workspace_manifest.json <- summary of the download run
| INCOMPLETE_TASKS.txt <- only if some downloads failed

```

Because both tools use the **same task folders**, the chat and the workspace files for each task sit neatly together.

7. Re-running & resuming

You can safely run these tools more than once.

- **Chat Exporter:** use the **Start** number in `2_RUN.bat` to resume where you left off (e.g. start at 51 if you already did 1-50).
- **Workspace Downloader:** it **skips tasks that already have a populated workspace/ folder**, so a second run flies past finished tasks and only retries the ones that still need it. Just run `RUN_DOWNLOAD_ALL.bat` again and let it go — or use the numbers in `INCOMPLETE_TASKS.txt` to target specific tasks with the Start/End prompts.

8. Troubleshooting

Chrome page is blank / all white after `0_START_CHROME.bat` Press **Ctrl + Shift + R** (hard refresh). A fresh profile sometimes needs one reload before the app appears. Do NOT type `/login` — this app signs in from the main URL.

"Setup has not been run yet" Double-click `1_SETUP.bat` first.

"No task links found" Chrome isn't logged in or isn't showing your task list. Re-check Section 3 — Chrome must be open, logged in, and displaying your tasks, and no other Chrome windows should be open.

A download times out on a very large workspace The defaults allow 10 minutes to receive and 15 minutes to save each zip. If you have exceptionally large workspaces on a slow connection, raise `ws_download_timeout_ms` and `ws_save_timeout_ms` in `config.json` (see below).

The Workspace Downloader can't find the "..." button / panel Run `DIAGNOSE_WORKSPACE.bat` with Chrome open on a task. It inspects the page and writes `workspace_dom.txt`. Send that file back so the targeting can be tuned.

The Chat Exporter misses messages or tasks Run `DIAGNOSE.bat` with Chrome open and your task list visible. It writes `diagnostics.txt` and `page_dump.html` for review.

Nothing happens / it can't attach to Chrome Make sure you started Chrome with `0_START_CHROME.bat` (not a normal Chrome shortcut), and that all other Chrome windows were closed beforehand.

9. Advanced: config.json settings

You normally don't need to touch anything, but these keys in `config.json` are useful for the **Workspace Downloader**. Values ending in `_ms` are **milliseconds** (1000 = 1 second).

Setting	Default	Meaning
<code>ws_download_timeout_ms</code>	600000 (10 min)	How long to wait for a download to START/arrive after clicking "Download all". Raise for huge workspaces.
<code>ws_save_timeout_ms</code>	900000 (15 min)	How long to allow the zip to finish writing to disk. Raise for huge workspaces.
<code>ws_panel_ready_rounds</code>	30	How many times to check that the panel is fully loaded before clicking.
<code>ws_panel_ready_pause_ms</code>	1000 (1 s)	Wait between those checks (so default = up to ~30 s to confirm the panel). Raise if your panel loads slowly.
<code>ws_task_settle_ms</code>	3500	Pause after opening each task page before doing anything.
<code>ws_task_retries</code>	2	How many times to try a task before marking it incomplete and moving on.
<code>ws_skip_existing</code>	true	Skip tasks that already have a populated <code>workspace/</code> folder.
<code>ws_unzip_archive</code>	true	Automatically unzip <code>workspace.zip</code> into the <code>workspace/</code> folder.

For the **Chat Exporter**, the `formats` key controls output types (`[ "markdown", "json", "html" ]`), and the memory-safety options (`memory_safe` , `gc_every_steps`) help with very long chats — leave these as-is unless advised.

To edit `config.json` , open it in Notepad, change a number, and **save**. Keep it valid JSON (commas between items, double-quotes around names).

Quick reference (the short version)

1. **First time only:** double-click `1_SETUP.bat` .
2. **Every time:** close other Chrome windows → double-click `0_START_CHROME.bat` → log in → see your tasks → leave it open.
3. **To save chats:** `3_TEST_FIRST_5.bat` to test, then `2_RUN.bat` for all.
4. **To save files:** `TEST_DOWNLOAD_FIRST_5.bat` to test, then `RUN_DOWNLOAD_ALL.bat` for all.

5. **Results:** in the SuperNinja_Export folder. Any failed downloads are listed in INCOMPLETE_TASKS.txt .
